

USER SCENARIOS – HIDROSANITARE AGOLLI

Scenario 1: Product Sale

Scenario: A customer wants to purchase sanitary products from the store.

Main Sequence:

1. The customer selects products from the store.
2. The salesperson logs into the system.
3. The salesperson searches and adds products to the invoice.
4. The system checks stock availability.
5. The salesperson confirms the sale.
6. The system generates the invoice.
7. The stock quantity is automatically updated.
8. The customer receives the invoice.

Alternative Sequence:

- If stock is insufficient, the system displays a warning message.
- If invoice generation fails, the salesperson can retry the process.

Special Requirements:

- Automatic stock update.
- Secure invoice generation.

Post-condition: The sale is completed and stored in the database.

Scenario 2: Supplier Delivery

Scenario: The warehouse receives new products from a supplier.

Main Sequence:

1. The warehouse staff logs into the system.
2. The supplier delivery is registered.
3. Product quantities are entered into the system.
4. The system updates the stock automatically.
5. Supplier invoice data is stored.

Alternative Sequence:

- If product data is missing, the system requests completion.

Special Requirements:

- Real-time inventory update.

Post-condition: New products are added to stock.

Scenario 3: Customer Registration

Scenario: A new customer wants to be registered in the system.

Main Sequence:

1. The salesperson opens the customer module.
2. Customer personal data is entered.
3. The system validates the information.
4. The customer profile is saved.

Alternative Sequence:

- If required fields are empty, the system requests completion.

Special Requirements:

- Customer data validation.

Post-condition: Customer information is securely stored.

Scenario 4: Payment Registration

Scenario: The accountant registers a customer payment.

Main Sequence:

1. The accountant accesses the payment module.
2. The invoice is selected.
3. Payment details are entered.
4. The system updates the payment status.

Alternative Sequence:

- If payment fails, the system displays an error.

Special Requirements:

- Secure financial transactions.

Post-condition: Payment information is stored successfully.

Scenario 5: Inventory Report Generation

Scenario: The administrator wants to view inventory reports.

Main Sequence:

1. The administrator opens the reports module.
2. The desired report period is selected.
3. The system retrieves inventory data.
4. The report is generated and displayed.

Alternative Sequence:

- If data is unavailable, the system notifies the administrator.

Special Requirements:

- Fast report generation.

Post-condition: Inventory reports are available for review.

Scenario 6: Low Stock Alert

Scenario: The system detects products with low stock.

Main Sequence:

1. The system monitors product quantities.
2. A product reaches the minimum threshold.
3. The system generates a low stock alert.
4. Warehouse staff receives the notification.

Alternative Sequence:

- If stock is replenished, the alert is removed automatically.

Special Requirements:

- Automatic notification system.

Post-condition: Low stock products are identified quickly.
